ABSTRACT

A two-part syringe comprises two chambers (2,4) each chamber having an associated plunger (6,8) operable to eject fluid therefrom. The plungers (6,8) are interlinked so as selectively to prevent movement of one of said (6,8) plungers in its respective chamber (2,4) dependent upon the position of the other plunger (8,6). Such an arrangement allows lyophilised drugs to be automatically reconstituted within the syringe prior to injection into a patient.
